Dear Mr. Newark.

The pictures were taken on the Puslinch - Flamborough townline. This road was aligned roughly N.W. to S.E. The funnel was moving in a south-easterly direction towards Burlington. I have since purchased a decent compass should a similar sighting happen again. As you know the winds that day were from the South-west and quite gusty. During the time the funnel developed to the time it dissipated there was a dead calm and absolutely no sound. This was a one minute interval.

The storm developed ahead of the cold front as a line of storms moved through a location farther to the north about 45 minutes later. This line was associated with the front. The funnel rotated quite slowly, probably no more than 35 km. / hr.

I hope this information is of some value.

Yours truly,

R. K. McClellan.
